Summary

Software engineer with five years of experience building software, still a little in awe that ones and zeros carried humans to the moon. I love taking a challenging real-world problem and working out, through computational thinking, how software can make it simpler and more convenient.

Two of the problems I have taken on: Ripplx reads a company's SEC filings, flags what changed, and cites every claim to its source, so an analyst checks a sentence instead of rereading the filing. OwenWrites helps novelists keep each character's voice consistent across a full manuscript, whichever AI model they draft with.

My transdisciplinary study, an undergraduate liberal arts education and an MS in AI-Driven Innovation, helps me understand the people and organizations software is meant to serve while going into the technical depth and rigor of AI research. I use those advances to build tools that make everyday work faster, more efficient, and more effective.

Technical Skills

Languages: Python, Java, C++, C, TypeScript, JavaScript (ES6+), HTML5, CSS3, SQL
Frontend: React, Next.js, React Hooks, Redux and Context state management, Tailwind CSS, Vite and Webpack, responsive and accessible UI, Jest and React Testing Library
Backend & APIs: FastAPI, Node.js, Express, REST API design, JWT authentication, role-based access control, WebSockets, background jobs, async processing
Data & Databases: PostgreSQL, MySQL, SQLite, MongoDB, Redis, Prisma ORM, pandas, NumPy, schema design, query optimization
AI Systems: Anthropic, OpenAI, and Gemini APIs, AI agent workflows, retrieval over vector databases (RAG)
Cloud & DevOps: AWS (Lambda, S3, EC2, IAM), Docker, Git, CI/CD (GitHub Actions)

Professional Experience

Claremont Graduate University Claremont, CA
Software Developer | Graduate Assistant *August 2025 to Present*

- Built the academic advising assistant in Python and FastAPI around the questions advisors field most often, so students get a clear answer on program policy without waiting for office hours. Over 500 questions handled, and roughly 40 percent fewer of them now reach a human advisor.
- Every answer is referenced against the official policy documents before it goes out. Questions those documents do not cover are held back for a conversation with an advisor, so no student acts on a misreading of policy.
- Questions are routed by topic to guidance tailored to that area of policy, which is what made answers consistent from one student to the next. Responses arrive in under two seconds, and a failed step is retried rather than dropped.

AI for Humanity Lab, Claremont Graduate University Claremont, CA
Software Engineer | AI Research Fellow *September 2025 to Present*

- Lead the organization of the CGU Hackathon, a campus-wide event open to students across the Claremont Colleges, to draw out creativity and ingenuity in problem solving across AI, software engineering, UI/UX, cybersecurity, and GIS, and to grow a campus culture of building, curiosity, and teamwork.
- Research the latest AI releases and published research each quarter and what they mean for human dignity, transparency, and trust, and write them up in plain language for the lab's quarterly AI report, published with the lab's directors, fellows, and volunteers.
- Built a tool in TypeScript and Playwright that checks whether a website's AI disclosure, the notice telling people they are dealing with AI, can actually be seen and noticed. Existing scanners only confirm the text exists somewhere in the page code.

Soka University of America Aliso Viejo, CA
Full Stack Developer | Office of Alumni Relations Assistant *August 2024 to July 2025*

- Wrote a real-time alerting service in Python and PostgreSQL that reads NASA's live disaster feed, checks each event against the alert rules, and notifies any of 2,000+ alumni living near the affected region, so the office reaches them the same day.
- Set up CI/CD with GitHub Actions and environment-scoped credentials, and added a one-hour cache on the NASA feed to cut the repeated external API calls that had been driving up usage.
- Built a full-stack inventory system for the same office in React and Node. Fuzzy search and better category tagging cut item lookup time roughly in half.

Nepal Technical Service Butwal, Nepal

Full Stack Engineer | Co-Founder *January 2023 to August 2025*

- Replaced the spreadsheets a retail business ran on with a sales, inventory, and accounting platform in Next.js, TypeScript, and PostgreSQL, plus a Flutter Android app for the shop floor.
- Kept the books balanced through retries, dropped connections, and returns by posting every entry through a double-entry ledger that refuses any write where debits and credits differ. Money is stored as exact decimal amounts down to the paisa, with gold tracked by weight in its own sub-ledger, because rounding drift is the kind of error that surfaces six months later in a reconciliation.
- Each sale is recorded exactly once, even with two clerks at the counter and a payment callback retrying, and invoice numbers stay gap-free for the auditor. Five access levels from owner to viewer keep the person entering a sale from editing the ledger, and a closed period can only be fixed with a correcting entry, never an edit.

Projects

Ripplx, AI Research Assistant for SEC Filings | Python, FastAPI, PostgreSQL, React

- Reads a company's 10-K and other SEC filings against the prior period and writes a short brief of what materially changed, the reading an analyst or investor would otherwise repeat every filing season. It also watches for shifts in tone in the risk sections and for concerning patterns such as revenue growing faster than the cash coming in.
- Every claim in a brief cites the exact sentence it came from, and every number is checked against the figure the company filed. A brief that fails a check is held back, because someone putting money behind a conclusion should be able to see where it came from.
- Adding brokerage connections, starting with Robinhood, so an investor sees how a filing change bears on the holdings they already own rather than on one stock in isolation.
- Building a research agent that, when someone is weighing a purchase, assembles a cited analysis of the company, its industry, and its key financial metrics, the first draft an associate would otherwise have to put together.

OwenWrites, AI Writing Platform | React, TypeScript, FastAPI, vector search

- Built a writing platform in React, TypeScript, and FastAPI that helps novelists keep each character's voice consistent across a full manuscript, with OpenAI, Gemini, and locally run models behind one interface so a writer can move a draft between them.
- The manuscript is split into passages and indexed in a vector database, so when a writer asks how a character has spoken before, the answer is drawn from their own pages rather than from the model's guess.

Education

Claremont Graduate University Claremont, CA

MS in AI-Driven Innovation *Available for full- or part-time roles from December 2026 | Graduating May 2027*

- Fourth place out of 30+ teams, CGU Ethical AI Hackathon, November 2025, for BlueHabit, a route planner on ESRI GeoAI and Claude Sonnet that finds walkable routes for wheelchair users and visually impaired residents from air quality and satellite data.
- Coursework: Software Development, Database Systems, Communications and Networking, Building Generative AI Apps, Natural Language Processing

Soka University of America Aliso Viejo, CA

BA in Economics and Finance *May 2024*

- Coursework: Financial Modeling, Regression Analysis, Business Statistics, Financial Economics
